PRESENTATION

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

Good afternoon or good morning, everyone. Happy to be with you again today. So, before Jean-Pierre goes through the details of this first quarter financials, I would like first to make a few opening remarks in particular on the conflict in the Middle East and its consequences.

As you know, this region, Middle East, holds, of course, a very special place for TotalEnergies. It's deeply rooted in our DNA, in our history, in our identity, because it is where the Company was born in 1924, in Iraq. And more importantly, this is a region where we have established, along the years, a prime position which differentiates us.

Since the very first day of the conflict on February 28, our priority has been first the security of our teams and their families. We have decided, just two days after, to organize the evacuation of employees' families and as well as some non-essential employees out of the UAE, Qatar, Iraq, Saudi Arabia, Jordan, and Lebanon. Thanks to the strong mobilization in all our affiliates in the regions, but also around the globe and also at the headquarters, more than 1,300 people have returned safely from the countries concerned by the conflict, and I want to thank all the teams who participated to that strong effort.

Safety of our staff will remain our utmost priority, but I want also to reiterate here our full solidarity and support for the population of these countries which suffers as a consequence of the conflicts. I want to reaffirm TotalEnergies' commitment to all our local partners, contractors, and customers.

From this point of view, I want to underline that we kept a presence in all the countries, along our partners. For example, in Abu Dhabi, all our secondees working for the ADNOC JVs are maintained on the ground. It's the same situation in Qatar. We have also sent some experts to assist QatarEnergy in evaluating the damage and the repairs necessary to the two LNG trains which were damaged during the conflict.

We have maintained a team in Iraq, in Basra, of 20 TotalEnergies' staff, who are supervising the progress of the GGIP projects on the ground, with around 5,000 workers there. And also in Saudi Arabia, we have, of course, maintained most of our secondees in order to supervise the Amiral project, which mobilizes today 22,000 workers.

So, my message on this, first, is to thank all our teams which are again working hard in the region facing the situation. I went myself last week to visit them, and I can tell you I had a strong feeling of high mobilization of everybody facing these adverse events. And also, I met, of course, our partners and authorities to reaffirm our commitment to the region.

Of course, we will have to draw some lessons from what happened, in particular to envisage some alternative evacuation routes for the production of oil in the region, but that will come after the conflict. This conflict immediately has some impact on TotalEnergies' operations. And we have been, by the way, very transparent, since day one, to disclose all the impacts on our activities.

At this stage, production is shut down in Qatar, Iraq and UAE offshore, which represents approximately 15% of the total Oil & Gas production of the Company, more precisely, 360,000 barrels per day, because we continue to produce onshore UAE production, oil productions of 210,000 barrels per day TotalEnergies' share, which is evacuated through Fujairah terminal, out of the Strait of Hormuz. And we also continue to produce Dolphin gas between Qatar and UAE because it's a domestic Gulf production.

While this is a significant portion of our Upstream production, these Middle Eastern assets contribute less to our cash flow per barrel than the rest of our portfolio due to higher taxation in the region. This 15% of volumes, a little less, 360,000 barrels per day, only account for roughly 10% of our Upstream cash flow at 60 \$/b.

The Company's cash-accretive growth expected for 2026 is largely outside the Middle East, and you've seen that through the results of the first quarter. Meaning that the higher oil price observed since the start of the crisis, more than offsets, of course, the loss of production in the Middle East. An equivalent of 8 \$/b increase in the Brent is enough to offset the expected 2026 cash flow from the shut-in production. And we are, of course, today, more 100 \$/b, I think even 115 \$/b this morning, which in terms of our sensitivity to price, represents substantial additional cash flows.

The impact of the LNG production shutdowns in Qatar or in Abu Dhabi on our LNG trading activities are, in fact, very limited, as our exposure to our marketing portfolio is limited to 1.5 Mt for the remainder of 2026. I remind you that most of the LNG produced by our JVs in Qatar are, in fact, marketed by QatarEnergy itself and not by TotalEnergies.

Finally, on our refining activities in the region, the SATORP site, which is owned jointly by Aramco and TotalEnergies, was impacted by strikes that occurred during the night of April 7 to April 8, causing damage to three units. No casualties were reported. As a safety precaution, the units were immediately shut down. A partial restart occurred on April 14, allowing production to resume at a 50% capacity, 230,000 barrels per day. And the repair work on one of the units, the VDU, is well underway, and we expect to restart and to increase production to more than 300,000 barrels per day from the early days of May, May 5 or around. So that's the situation for assets.

But this conflict, of course, has consequences beyond the only perimeter of TotalEnergies, and now will impact the course of 2026 very significantly in terms of markets. Of course, the damage to Upstream assets has been limited so far. The closure of the Strait of Hormuz constitutes a major disruption to the world energy system, as it affects around 20% of worldwide crude oil, refined products and, of course, LNG exports. And there is very limited spare capacity of production outside the Gulf, in reality.

The immediate consequence was a surge in oil prices, which are now around 100 to 115 \$/b, which have been extremely volatile, with major swings in the past weeks. Some days have been the highest days, I even think we experienced eight of the ten highest volatile days in the last 25 years during the months of March and April.

So given the time required to restart facilities, but also more importantly, to reach the final markets because an oil tanker which will be loaded in Abu Dhabi or in Saudi Arabia will take 25 days of shipping to reach its customers in Asia, Korea, Japan, and so there is a time lag. Even if the war was to end quickly, prices are expected to remain at high levels. And in all the scenarios I can read, and I agree with the scenarios I'm reading, either from the IMF or from some banks, at least 80 \$/b is expected for 2026.

In fact, the reality is that the 2026 surplus scenario that was anticipated by the markets and by us, by the way, at the beginning of the year, is now over, is behind us, with global hydrocarbon inventories being materially drawn to balance the market, already at a pace of 10 to 13 million barrels of oil per day. We have already consumed, I would say, 500 million barrels out of inventories. And with the phenomenon I described, to restart and to reach the market, it's probably more in the range of 1 billion barrels, which will at least be consumed from the inventories. We would exit even if the conflict, and I hope so, will end in the month of May, we would exit the conflict with clearly some very low inventories.

This conflict also has some impacts on the LNG markets and prices. We have seen that the European gas price established today at around 15 \$/MBtu. But, again, we are facing now, by this summertime, the peak season for LNG because it's not only the warm summer season in Asia which will call for more LNG demand but also, it will be the

season where Europe will have to replenish its storage. And as you know, at the end of the winter season, we were at the lowest point of the last five years in terms of European gas storage, around 25%. And we anticipate as well, and I was in Qatar, that QatarEnergy will wait for real stabilization of the Strait of Hormuz before they restart the liquefaction plants. You cannot turn on and turn off these plants easily. It will also impact the time it will take to reach the market. So that's on LNG. And I would not be surprised to see some support for higher prices by summer season, considering this timeline or time lag that LNG could go back to the market, and Qatar's LNG represent almost 20% of the world market.

So, in this context, strategy of TotalEnergies demonstrates once again the ability of the Company to capture price upsides, thanks to major strategic strengths of the Company. And also, I must say and I compliment the teams because of the strong operational performance, which of course is of essence in such markets during the first quarter. First, of course, we are integrated along the value chains of oil, gas, LNG, and electricity. It allows us to capture margins and prices all along the value chains and provides us with a unique combination of activities in oil, gas, and electricity: being a low-cost producer, transforming them into added value products which can then be traded on the market and sold to our B2B, B2C customers.

Secondly, we are a growing Company, with strong organic growth. Then we are demonstrating, quarter after quarter, our ability to strongly grow our production, as you have seen a 4% year-over-year organic production growth for the Oil & Gas business and also, of course, our electricity business. 4% for Oil & Gas was above our annual guidance of 3%, which, of course, helps to offset, it was completely offset during the first quarter, and it will be partially during the second quarter, the impact of the Middle East conflict. But more importantly, it allows us to capture the upside of the high prices because the incremental production, the new production that we put on stream, is more accretive and generates more cash flow per barrel than the average of our portfolio.

Third, we are diversified, and I think this is again a strong lesson in this crisis. Strong diversification and a rich and diversified portfolio allowed us to compensate again the impact of the crisis in the Middle East, from our geographically diversified portfolio of oil and LNG outside of the region. It notably allowed us to activate the flexibility of our LNG portfolio to ensure the security of supply of all our customers. And the diversity of the LNG portfolio - we are producing in eleven different countries - allowed us to serve our customers in Asia, re-rerouting some non-contracted volumes that we have in our portfolio to them, and not to declare any Force Majeure in our contracts. I can assure you, because I visited some customers in Asia, that they appreciated very much the value of the contract commitment at TotalEnergies.

It's another example of the optionality of our diversified portfolio, and more than ever, the decision to restart the Mozambique LNG construction in January could be fully appreciated because it's a way of diversification which will be good for our portfolio by 2029. There was an article recently in a journal, saying that Mozambique will be the Qatar of Africa, and we are proud to build this project in Mozambique, and it will help us diversify. I would say as well, as we are working hard, these events are giving a good momentum to sanction Papua LNG before year-end.

In this context, of course, compared to the beginning of the year where we were all cautious, there are no reasons not to fulfill all our commitments for strong returns to shareholders. And I think the Board has taken decisions yesterday that I'm happy to report to you. And considering, of course, the strength of the balance sheet, but also the environment and taking into account the ability to demonstrate our growth, priority was again given to what I call the sacrosanct dividend, by continuing our strong track record of dividend growth. We have decided to increase the first interim dividend by 5.9%, above probably market's expectation, to 0.9 €/share, compared to last year's interim dividend, which

was 0.85 €/share. We confirm once again the leadership of TotalEnergies, not only in terms of dividend resiliency, but also more important, dividend growth among the Oil & Gas majors.

Secondly, we are, very pragmatic and consistent once again, in view of the current projections of the evolution of the prices, not only the second quarter, but as I said, along the year 2026, the Board of Directors gave us the authorization to continue, of course, the share buyback program up to the high end of the range that we gave last February, which was 750 M\$ to 1.5 B\$ per quarter. We'll target the high end of this range, up to 1.5 B\$ per quarter.

The Board also reiterates the objective to achieve a cash payout ratio above 40% for the full year 2026, and we will monitor buybacks accordingly throughout the year. Keep as well in mind that in terms of capital allocation, Board attached great importance to deleverage the balance sheet, and we would be happy to see it gearing in the low 10s by the end of 2026 if the crude oil price were to remain above 100 \$/b.

On that note, I will turn now the call to Jean-Pierre who will go through the details of the first quarter's financials.

Jean-Pierre Sbraire - TotalEnergies SE - CFO

Thank you, Patrick. I will start by commenting on the price environment in the first quarter versus the fourth quarter of 2025. Brent averaged 81 \$/b during the first quarter versus nearly 64 \$/b in the fourth quarter of 2025, up more than 25%. And average liquid price was up by 12.4 \$/b due to the time lag effect in particular in the United Arab Emirates.

TTF averaged 13.7 \$/MBtu versus 10.3 \$/MBtu during the fourth quarter of 2025. And our average LNG price stayed at 8.5 \$/MBtu, oil price increase impacting LNG prices with one or two months of lag time according to LNG pricing formulas.

Finally, the European refining margins remain at 11.4 \$/b on average over the quarter, with exceptional margins in March and poor margins in January and February.

In this price environment, the Company reported very strong financial results, with first quarter of 2026 cash flow of 8.6 B\$, increasing by 20% compared to the fourth quarter of 2025 and adjusted net income increasing by more than 40% to 5.4 B\$. These results, as already highlighted by Patrick, were possible because of strong operational performance of all businesses, which demonstrated the Company's ability to fully capture the environment upsides.

Upstream delivered a 4% Upstream underlying accretive production growth, offsetting the production loss due to the crisis in the Middle East. In Downstream, the very good operational performance of our refineries, with the utilization rate on average over the quarter, above 90%, allowed us to capture high refining margins in March. And trading was also able to take benefits from the high market volatility in March and delivered high performance on crude, petroleum products, but also LNG.

TotalEnergies has delivered a strong profitability this quarter, with return on equity at 14.4% and ROACE at 12.7%.

Now moving to the business segments and starting with hydrocarbons. On a year-on-year basis, excluding the impact of the Middle East conflict, first quarter Oil & Gas production exceeded expectations and increased by more than 4%, above the guidance provided of 3% for 2026. As communicated by the Company from the very beginning, the production was impacted by the conflict in the Middle East, with an impact of around 100,000 barrels per day on average for the quarter, which correspond, on average, to around 25 days of disruption during the month of March.

Turning to quarterly results and starting with E&P division, the segment generated an adjusted net operating income of 2.6 B\$ this quarter, up by more than 40% quarter-to-quarter, fully capturing the increase in average liquids price of 12.4 \$/b over the quarter and demonstrating the accretiveness of the new projects. This quarter, Lapa SW in Brazil and Mabruk in Libya started up and will each, once ramped up, bring an additional production capacity of 25,000 barrels oil equivalent per day. Similarly, cash flow reached, for E&P, 4.6 B\$, up 26% quarter-to-quarter. On the cost side, once again, we maintained our leadership, with an average Opex below 5 \$/boe in the first quarter of 2026.

On integrated LNG, on the production side, LNG production has grown significantly by 12% quarter-to-quarter, mainly supported by growth in Australia, with Ichthys LNG back to full capacity during the quarter, the United States and Malaysia. First quarter LNG sales reached 12.4 million tons, supported by strong spot activity, giving us a strong start compared to our yearly guidance of more than 44 million tons. Supported by this growth and strong trading activity capturing market volatility, the adjusted net operating income of Integrated LNG increased significantly quarter-to-quarter to 1.3 B\$ and cash flow to 1.8 B\$. Given the evolution of the Oil & Gas prices in recent months and the lag effect on pricing formulas I already mentioned, the Company anticipates an average LNG selling price of around 10 \$/MBtu for the second quarter of 2026. As we execute our consistent strategy in LNG, the main milestone of the quarter was the full restart of construction activity at our Mozambique LNG project, with more than 6,000 people already on site as we speak. This project will broaden the diversification of our LNG supply, a strength that the current crisis has put additional emphasis on.

Turning to Integrated Power now. Net power production increased year-on-year to 11.7 TWh, with a 20% growth of power generation from renewables, offsetting the lower utilization of gas flexible capacities in the context of lower winter demand in Europe and in the United States. TotalEnergies has increased its renewable capacity by nearly 8 GW over a 12-month period, on track to reach its objective of 42 GW gross installed capacity at the end of the year.

Cash flow from operations was 0.6 B\$, as no farm-downs were registered during the first quarter of 2026, unlike in the fourth quarter of 2025. This quarter, again, we provide more granularity in Integrated Power financial performance, with a split in cash flow between production assets on one side, renewable and gas-fired plants, and sales activities on the other side, B2B, B2C, and trading. The former contributed 35% of the cash flow and the latter for 65%, in line with the first quarter of 2025, due to the seasonal nature of the marketing business, with more consumption obviously during the winter. And given the closing of EPH deal that we announced this morning, TotalEnergies has now a 50% interest in a portfolio of flexible power generation assets in Europe, and Integrated Power should then benefit in 2026 from 10 TWh net power production, in line with the 15 TWh guidance given for a full year, and more than 500 M\$ contribution to available cash flow in relation with this EPH deal.

Moving to Downstream, and during the first quarter, Refining & Chemicals was able to capture the exceptional margins in March, thanks again to the high availability of the refineries which recovered their full operational performance. It was particularly the case in Port Arthur in the U.S. and Donges in France. Utilization rate reached 92% in the absence of planned turnarounds, and trading activities were also very strong for crude and products, taking benefits of the market volatility. Overall, for Refining & Chemicals, adjusted net operating income was up by nearly 600 M\$ quarter-to-quarter to 1.6 B\$, and cash flow reached 1.7 B\$. In Marketing & Services, results remain consistently strong and reflect the seasonality of the business, with higher margin activities offsetting lower volumes, linked to the disposal of some assets in Brazil and in Sahel in Africa.

Moving to corporate, at Company level, and starting with working capital. Working capital increased by 5.1 B\$ during the first quarter, out of which 2.5 B\$ is related to guided business seasonality, and 2.6 B\$ that reflects the impact of higher hydrocarbons prices at the end of the quarter, notably on inventories.

While the context remained quite volatile, we deployed our investment program with discipline, with net investments that amounted to 4.5 B\$ in the first quarter, with a neutral balance between acquisitions and disposals in line with our quarterly budget. We therefore reiterate full year 2026 net investment guidance of 15 B\$.

As a result, the gearing lands at 15.5% at the end of the quarter, with cash flow growth driven by higher energy prices, partially offsetting in particular the impact of high prices on the working capital.

Looking forward now, we expect to maintain strong momentum with hydrocarbon production, excluding Middle East impact, in the second quarter, expected to grow around 4% compared to the second quarter of 2025, in line with the growth we registered during the first quarter. As we speak, as mentioned by Patrick, production shut down in the Middle East still represents around 15% of the Company's total production. And we anticipate refining utilization in the range 80% to 85% in the second quarter of 2026, which accounts for a two-month scheduled maintenance at Donges and the impact of the capacity reduction of SATORP commented by Patrick.

As I mentioned, the Company confirmed it expects its yearly net investment to be at 15 B\$ for the full year, in line with annual guidance. Therefore, net investments should trend downwards in the second quarter. Meanwhile, the Company is evaluating options to accelerate short-cycle investment to capture current hydrocarbon price environment.

To conclude, this set of growing earnings clearly demonstrate, in our view, the strength of our integrated model in oil, gas and power, which enabled us to seize price upside in the first quarter and put us in a strong position for the second quarter and the rest of the year.

With that, I think with Patrick, we are now available to answer your questions. You can open up the line for questions, please.

QUESTIONS AND ANSWERS

Michele Della Vigna - Goldman Sachs

I wanted to ask two questions on LNG. The first one is about whether with all of this crisis, you're starting to see a resurgence of demand for oil-linked long-term contracts and if that can unlock more LNG projects for you, like for instance, PNG.

But longer term, I was also wondering if this crisis may actually be a bit more concerning and reduce some of the dependence on hydrocarbons from Asia, for instance, turn some of those countries more towards coal, solar and energy storage as an alternative. And if that could actually make perhaps what already looks like probably an oversupplied LNG market from 2028 last well into the next decade. Thank you.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

I will take the second one first, Michele. It's quite clear, for our customers in Asia, a crisis in 2022, another one in 2026, reliability from an affordability point of view of the LNG will be questioned. And that's why, by the way, we think we have to promote to them the idea of long-term contracts, not only related to spot price. That's very clear. That's what the European countries, because of the rules, are not benefiting from. I think the current crisis should influence them and put them more on this type of long-term contract. You are right.

That way, the whole planet, not only in Asia, the governments will look again to, like we were in the '70s, domestic production first, domestic energy first, whatever it is, coming from coal when you have coal, or coming from biofuels. By the way, Malaysia, Indonesia are beginning to raise their biodiesel content, very logically. But coming to renewables, of course, as well, and from this position of Company, TotalEnergies could benefit from it because we are also investing in electricity. And electrification will be also a global answer, because you can produce electricity from various means and not only from hydrocarbons. So that will be the other big trend, that we will see, because security of supply, because again affordability of energy is of essence.

It's not very good news, I agree, for the LNG markets. As you said, probably the result of this crisis as well is that we push back some of the famous wave, I think, because there will be some delays in some projects, because we don't know today how long the war will last. We have no idea. I have always said that in 2026, we'll remain at a good price. I think that for 2027, we can be optimistic. Then what you said, the oversupply in LNG market will come from 2028. But I would say that it's not bad for customers to have an oversupplied market. One of the observations I've done, when I observe what happens today with the crisis, it's quite remarkable: I know only two markets today where there will be no impact of the crisis on the energy price. One was the U.S. domestic gas price, the Henry Hub, that still remains lower, at 3 \$/MBtu instead of 4 before, or 3.5. Why? Because there is an oversupply, there is overcapacity. The Permian gas is now connected through pipelines.

And the other market I observe is the French electricity market. No impact at all because also of overcapacities of nuclear and renewables, by the way, both. So we produce too much. And that means it is a way to secure the affordability.

From this perspective, because of what you said, and the fear which could be generated to an LNG customer, the fact that we'll enter at a certain point - when? probably more summer 2028 than before or winter 2028 - a lower cycle, will be good to convince them to come to us.

I'll make a link with your first question. Honestly, today, I think we were happy and lucky to have signed a lot of oil-linked contracts because in this context, where there is sort of a bullish price overall, we have always quite been bullish, but I think this context, the crisis, will also impact the oil markets. Because there will be now something which was even completely hypothetical, in fact only on the risk cartography, which was the closing of the Strait of Hormuz, which became a real possibility to materialize. This threat has materialized.

And you have, in the Gulf, more than 20%, 25%, 30% of the Oil & Gas resource. Clearly, this will have an impact on the way that the markets will take this threat into consideration, even if we go down to a stabilized situation for Strait of Hormuz, it will have an impact on the markers, on the Middle East markers.

Today, I think we are happy to see that. We see appetite from Asian buyers for Papua LNG, not only because of the contract, but because of the geographical position. Of course, Papua LNG is perfectly located, not far from them, outside. So any diversity is good. On our side as well, because of this geography, we will see if we sign long-term contracts for Papua LNG, or if we keep some LNG for our own portfolio because we like this LNG as well for our own portfolio. But, again, no problem on this perspective to sign and we might be, I would say, in this context, a little tougher in the negotiation.

What I've observed the last week, some Asian buyers come back to "Henry Hub +" because they just observed what happens and the stable and affordable gas marker is the Henry Hub. I think that there will be quite a lot of new popularity for the "Henry Hub +" if some LNG offtakers want to sell their LNG there.

But definitely, this crisis has an impact on all these global LNG markets. Having said that, you've seen our results during the first quarter. When you have a strong, diversified portfolio, you can do good results when you have volatility, and I think we demonstrated that with our teams during the first quarter. I think we'll continue for the next quarter as well.

Biraj Borkhataria - RBC

Thanks for taking my question and thank you for the comprehensive overview of your operations. The first one, just on the comment in the release around accelerating short-cycle investments. Could you just unpack that a little bit more? What opportunities are you looking at? And secondly, what are you looking to see macro-wise or otherwise to put that capital to work?

And then, secondly, just a follow-up on Papua New Guinea. Could you just talk about the steps from here to FID? Are the fiscal terms all now agreed and tendered and so on? Just any uncertainties there at FID. Thank you.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

First question, I mean, you would have been surprised that we didn't mention that, so I was sure I would have a question. So it's quite natural as CEO of the Company that I've asked my E&P teams "is there anything to accelerate on the short cycle to benefit from the higher price deck?" Because again, on 2026, I'm quite confident, it's difficult in this world, but to see at least 80 \$/b, I think I would put quite a lot of my own money on it for the rest of the year.

By the way, it's an exercise which is moving on. I know there are a few countries like Angola, for example, where they have some ideas. So if we need to dedicate a few hundred million dollars to that, I would do it. Maybe I will tell you at

the end of the day, it's not 15 B\$, but 15 to 15.5 B\$. But you will accept it if it's profitable on the short term. Honestly, I'm not sure it's so big because, in fact, when we built the budget, we did not arbitrate a lot of short-term cycles.

In fact, we had a list of what we could cancel in case the price of oil was going down to 50 \$/b. So we prepared in case of adverse market. But we have asked the questions, and I know that because I visited some countries, they have some few ideas. I can be flexible on keeping the discipline. But, again, if we can generate some good free cash flow on the short term, everybody will appreciate it. So it is not probably as big as I just mentioned. It is probably a few hundred million dollars that we could mobilize, subject to capacity to have the rigs, et cetera. So, we are working on it with some countries.

On Papua LNG, I think you know it's a big project, good many partners. We have at least four workflows in parallel. The Capex side, I would say, and the EPC are progressing very well. We have made some recommendations to our partners. We are waiting for approval from one of them, I hope we will get it soon, so that we can move forward with these tenders.

In parallel to that, we have, I would say, the financing of the project, because there is project financing. Both are linked, by the way, because as you know, selection of the nationality of some contractors had an impact on the involvement of export credit agencies. There's a little sequence there: we need to have decided the contractors so that we can definitely confirm to the different credit export agencies. I think there is some appetite clearly from Asian credit export agencies, but also we discussed with the U.S. ones about it. And so, we are moving on the financing of it as well. So that's the second workflow.

The third workflow, as you said, is a discussion with the government. We have progressed, I would say. I could almost say finalized, but I didn't see the ink on the paper. Between the government and ourselves, there is an understanding on the agreement. Of course, it will have to be again approved by our partners. We are now in the process to close the loop, between partners, government, on these fiscal terms.

The idea there is somewhere to protect the project. The Capex will be around 14.5 B\$, it's not too cheap. It's much better than the 18 B\$, but it's still not cheap. So the idea is to protect the project when the prices of oil are low and to give back some when the prices are high, above 90 \$/b, I would say. So there is a sort of trade-off, which would be good.

And the fourth one is the marketing. On the marketing, there is some progress, quite a lot of progress. But again, on our side, the more we look to Papua LNG, the more we have appetite for the LNG located in that region and diversifying our portfolio. So it's possible that we could market not only our LNG, but the one of Kumul as well. We could market maybe 1 Mtpa on the long term and keep the other 1.5 to 2 Mtpa for our own portfolio. We are looking to different options.

So all that is progressing. I would say the target is to sanction the project, for sure, before the end of the validity of the offers, which is I think around November. Because in this market, we don't want to reopen and to negotiate to extend offers, we could face some inflation there. And we are aligned, I think, with the partners on moving to the FID second half of the year, with the government, for sure.

There is a last point to clarify if I want to be exhaustive. We need to be sure of the way that the Kumul financing - you know there is a Kumul back-in - and we need to know exactly what is the back-in which will be exercised. But all these workflows, we are working on them in parallel to converge to the FID.

Lydia Rainforth - Barclays

Thank you, and good afternoon to you both. Two questions, please. Could you just touch on the early closing of the EPH transaction and what options that now gives you?

And then, secondly, could I come back to the cash return side? I just want to be clear about what sort of message is around where we see cash returns going through here. Obviously, you're at the top end of the guidance that you'd given, but that was at 60 to 70 \$/b. And I'm just trying to work out whether you would go beyond that or whether the priority then is the debt side coming down. I just want to be clear on the messaging around cash returns for the rest of the year. Thanks.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

First point, EPH. First, we have been, the teams have been very efficient. The antitrust supervisors also have been super-efficient because even in Europe, we did three calls to get the approval on these transactions, which allowed us to close early, end of April instead of end of June.

So that means that we are now entering into this new company, TTEP. At a time, which is not too bad because as the gas price are higher in Europe and the electricity price in a country like Italy, we have a big exposure now to Italy, Italy is facing some increase of electricity price. And so, this gas-fired power plant fleet will have a higher margin, in fact, some few euros per MWh, beyond, I would say, the normal average margin, so it's positive.

And the second good news, recently, the EPH team managed to get very attractive new capacity contracts for some plants in Ireland, around 200 £/kW. It's a third good news.

So, first, I am happy to join, to make it earlier, and it gave us, of course, options. As you know, now we have access to 50% of the electrons of all this CCGT fleet. And so, this will allow our teams to increase our trading business, but also to go to customers, to sell them clean firm power, combining gas and electrons coming from the gas-fired power plant, flexible electrons with the renewable electrons. So that's exactly the play. We will move forward. We gave you some indications in the press release about the impact. Because it's from 01/05/2026, we evaluate the impact on the production around 10 TWh, and we told you that the cash flow should be at least two-thirds of an annual cash flow, which means at least 500 M\$ of impact, maybe a little more. We'll see. Let's enter in the venture.

So it gives a push to the Integrated Power business, and you should see it next quarter and third and fourth quarter in the results and the cash, compared to this level where we are today.

Cash returns, I will be clear. We are going step by step. Yes, you're perfectly right on the buyback. We gave you at the beginning of the year 750 M\$ to 1.5 B\$, between 60 and 70 \$/b. We told you immediately on the second quarter, we'll monitor that quarter after quarter to be clear. We go to the high end of the range to 1.5 B\$ for this quarter. And then I have added in my comments that we are guided by another objective, which is 40% of payout.

If you make the math, you will see that if we are at 90 \$/b, for example as an average, it's an example, we need to go beyond 1.5 B\$ for the second and third quarter. The idea is to monitor it progressively because again I don't know if we'll be at 80, 90, 100 \$/b, but we reiterate this commitment and the Board reiterated the commitment in the press release, to give you the guidance at least more than 40%.

I have added to you that because more than 40% could be 40, 45%. I just added to you another guidance to tell you that if we were in a scenario of 90 or 100 \$/b, if there is some cash, priority will be also to deleverage the Company.

And if we are able to combine low 10s of gearing and higher buybacks, we will do it. That's the idea. I hope I'm being clear. I will not give you a precise scale. What happens at 75, 80, 85, 90, 95 \$/b? It's a mathematical formula. I'm not a perfect engineer, so I prefer you to guess now.

Martijn Rats - Morgan Stanley

Thanks for taking my question. I have got two, if I may. I wanted to ask you about the two-to-three-month sort of restart time that you mentioned in the release, and I was hoping you could elaborate a bit on what really happens in that period. What are the steps that are on the critical path that make this longer or shorter? Is it getting tankers back into the Persian Gulf? Is it well intervention? Are there critical components in some of the LNG facilities? Can you please make that sort of operational, logistical - sort of - what really drives that? And secondly, I wanted to ask you about Mozambique, where we are now with the total budget for the project and the start, the timeline. I remember 15 B\$, but I also heard 20 B\$. Can you just give an update on where we are now?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

On the second question, it is easy, it is 20 B\$. I have been consistent over the last two years. 15 B\$, it was a long time ago. We have told you that there were some interim costs because of force majeure. We have updated. We have been obliged to renegotiate some of the EPC contracts because four years after, of course, there has been inflation. I have repeated \$20B in all my speeches for the last two years. So I repeat 20 B\$ today, and this is the budget on which we are and on which we will put the financing, by the way, on the basis of 20 B\$. So the rest is rumors. Regarding the timeline, we have restarted in January. So we have 6,000 or more people on the ground today. I have been there with the President of Mozambique, and construction has begun on the first train, and the jetty, and all. On the timeline, the objective and the timing are to produce first LNG by 2029 from the first train. We are sticking to that timeline, and the mobilization is on its way to reach this target today. And on these projects, in fact, we spent some money not only to save good equipment, et cetera, during four years, but also to progress all the engineering and the procurement. All that has been done. It is very advanced compared to traditional projects. If I see the global progress of the project at the end of March, it's 42%, in fact. We are not starting from scratch. We have progressed on these projects. And so, it is a matter of being able to construct. By the way, since January, the security situation in Cabo Delgado is quiet, and well under control, thanks to the support of both Mozambican forces, but also Rwandan forces, which are committed to remain in the area.

Regarding the first question, I was actually reading the press release at the same time because, in fact, to restart facilities, it does not take two to three months. The two to three months covers the whole cycle that I described in my introductory speech. It is also about the way you will restart whole production. You will bring tankers, because the tankers today in the Gulf are all full. You have, I think, something like several hundred tankers that you need to exit. You need to bring some empty tankers back. Then you need to ship the new oil to some destinations in Asia. Like I said, it is 25 days of shipping. It is longer if you go to Europe. Restarting the wells is not very complex. In the Middle East, production is generally quite easy production. We don't expect difficulties from restarting the wells. It is more restarting the whole system, to re-stabilize it, to come back to the flow where, before the war, you had every day 50 oil tankers moving in, moving out of the Gulf, et cetera, and loading oil, or loading products. That is this cycle that we estimate to take two to three months. This is not exactly about restarting production facilities. It is coming back to a normal mode, which would have been more correct in our statement. What I said on the LNG side, I spent some time in Qatar, is that on the Qatari side, it is clear that, of course, we cannot afford to start up liquefaction plants and then shut them down

again if the crisis comes back. I think Qatar very wisely wants to observe a certain degree of stability in the situation before being able to restart. That might take a little more time, knowing that the LNG tanker fleet is not as big as the oil tanker fleet. You know, we need to move the LNG tankers, and we don't use, for example, the Red Sea with LNG tankers. So the voyage to come from the Middle East, from Qatar, to Europe is longer. You go around Africa. This is again an estimation of the time it will take to come back to a normal situation.

Douglas Leggate – Wolfe Research

Good morning everyone, I wonder if I could also squeeze in to Patrick and Jean-Pierre. First, maybe for Jean-Pierre, or for whoever wants to answer this. You are getting an opportunity with these windfall oil prices, obviously, to address your capital structure, perhaps. Obviously, working capital has bumped up your net debt, but you also, I guess, added another hybrid bond pending the redemption later this year. I am just wondering, where would you like to see the capital structure? In this environment, why hold any hybrid bonds, given those were something of an emergency issue during Covid?

My follow-up is just very quick, Patrick. I wonder if this environment, as it relates to refining margins specifically, has changed your view on Port Arthur as a core asset.

Jean-Pierre Sbraire - TotalEnergies SE - CFO

On hybrids, the intention has not been to increase the hybrids bond portfolio. We are opportunistic at TotalEnergies. The hybrid market was very good in January and February. By the way, it was before the crisis, so before the 100 \$/b price. We decided to do liability management and just to anticipate, in fact, the bonds that will mature at the end of this year by replacing them, on good conditions. It was 1.5 B€. That's all. It is not our intention to increase this portfolio. We are just benefiting from good markets at beginning of the year, in fact, to anticipate the redemption of the bonds.

Douglas Leggate – Wolfe Research

And what about the capital structure generally, Jean-Pierre? I mean, why not take the opportunity to lower the net debt?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

I have said that. The objective, if I want to reach a low gearing level in the low 10s, is to lower net debt fundamentally. So that is the way to reach low 10s. I have told you that it is one of the primary objectives, and that will be. If we are in a 90 to 100 \$/b environment, I convey to you the message of the Board: in the arbitration, we have, on one side, the 40% payout to shareholders, which will stick on. But if some of you ask me to go to 50%, I might answer you no. More than 40% is our commitment. With the extra cash, we prefer to deleverage and to lower net debt, going down to a 10% gearing, in the 10s and maybe lower, in fact. For me, that is clearly the trend, the direction we want to give you today. So, we share your view.

On Port Arthur, do you have a buyer for Port Arthur, Doug, or what? You have an idea in the head? No, honestly, Port Arthur is a very good asset. Today, it is making good results. I can tell you, it is a very positive asset in this environment. It has value for trading teams, because trading in our Company is, in fact, about optimizing our assets, the molecules

and the flows around the assets. They optimize molecules around our assets. It is the anchor point. We have a strong trading arm in the U.S., and Port Arthur is an anchor point, it is a tool for them.

On one side, for the refiners, it is a profitable asset, where we have also integrated a lot of petrochemical assets with BTP and Baystar crackers. It is an integrated platform.

Today, we benefit from good margins. For example, today, we have engaged, and we are on the verge of signing some trading contracts with Venezuela, with PDVSA, and part of the destination of PDVSA's heavy crude oil will be Port Arthur, and our traders are developing a trading scheme around flows from Venezuela to the U.S. Gulf Coast. I think that is the idea on Port Arthur. Yes, it is a good asset, delivering and contributing to the strong downstream results that we have experienced.

Lucas Hermann - BNP Paribas Exane

Thanks very much. Patrick, I wondered if I could ask you about the UAE news overnight and the decision to exit OPEC. What are your personal thoughts? How it leaves you thinking perhaps about the future and the robustness or otherwise of oil prices? Just general comments.

And secondly, if I can be greedy, any observations on Namibia over the last three months or how your sentiment towards that opportunity may or may not have changed as you've continued to look at the data? Thanks very much.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

On UAE decision it's difficult for us to answer. It is a sovereign decision by a state, in which we are heavily involved. We knew for some years, that the UAE were not specifically happy with the quota which was allocated to them. I think it's quite public by the OPEC because UAE have made (and we're contributing to it, we are one of the most exposed companies to the UAE onshore and offshore) the program to raise their capacity from: first to 4 and then to 5 million barrels per day. There was an official test in January, an official test for the OPEC, where we reached during a week 5 million barrels per day. So, it has contributed before the war to the good production which was delivered by TotalEnergies in the first quarter.

So, this is their decision. On our side, as the CEO of an Oil & Gas company, we support the OPEC role in the market. But I think that OPEC or OPEC+, I think that Russia will continue with OPEC, with Saudi Arabia in OPEC+.

And I think the UAE has also said that they will coordinate with the OPEC on the market. Clearly, when you read the statement of the UAE, they are investing for growth, and they want to benefit from the growth. That's the way I'm reading their statement.

Future for oil prices, honestly, Lucas, what happens today, you can see that the oil prices are not only relying on oil supply and demand and a pure logic. So, I think after 11 years as CEO, I've seen more period of external events influencing the market than really the market itself. So, we'll see the way that the different countries and the role that each country will want to play in that context.

On Namibia, I would say, good news for me in Namibia. We have engaged in January with the authorities at the highest level. I went myself, the Chairwoman of Galp, together. For sure, this combination of TotalEnergies and Galp in Namibia has been very welcomed locally, because it will help everything.

First, the sanction of Venus. On Venus, we have an agenda with the government, which is to make our best on both sides to sanction the project by the end of July, because we have there again some offers by end of July, tenders.

Why is it positive? Because they see our Company as being the operator of choice, and we can discuss with them not only on one project, but they see not only our commitment to one, but to at least two projects, if not more, with Mopane behind Venus. The plan is clear, we want to sanction Venus this year.

There is a discussion with the government to amend a very old Oil & Gas law from the beginning of the 2000s, which has never been really used in Namibia. In fact, we are the first to develop a very large project and an ultra-deep water project. That's the point on which I think the authorities understand that these ultra-deep water projects require some amendments to the standard terms. This is what we work on today with them. And again, there is a very good dynamic because we are both sides in a win-win situation, and both we see the perspective of the second project.

So, on the second project, Mopane, our plan, that will be approved soon, is to make sort of an appraisal program with three wells. We want to drill the first one.

But it's an appraisal program, and to be clear, not to check if there is a development. There is a development. The question for us is do we have 800 million barrels to develop or do we have 1.2 billion barrels? That's the question.

And we need to appraise, not to miss some resources by rushing to a first development, which will be not optimal. If there is more than 1 billion barrels, we might adapt geographically when you look at the map.

It's linked to the last well, which was drilled by Galp which opened some doors. But we want also to shoot some seismic, OBN seismic, to be sure that there is some resource. The rock on Mopane is better, the permeability is much better. So, we are more on a standard development, which will not require some fiscal discussions. We could do that with the terms because it's more classic.

For this one, the idea and the plan, which is approved with Galp, is to drill 2026, 2027, finish the appraisal, and then to move to sanction by 2028. So, one sanction in mid-2026, one in 2028, and maybe more because on these licenses are also still to explore.

Namibia will become for us a new anchor country. And by the way, it's a good (I know that I will have some questions about the Middle East) diversification again. To have options and to develop the options is a big lesson of what is happening. In Namibia, we are on a good momentum. I hope I will be able to report to you by end of July that we have really materialized the first project.

Lucas Hermann - BNP Paribas Exane

Is that still the completion date, Patrick, for the transaction?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

The transaction should be completed at the same time or a little before, in fact, a little before.

For the transaction, it's more paperwork, to be honest, because the partners have lifted their preemption rights. We are more on the paperwork with the Namibia government in order to move forward, and that's it.

Alastair Syme - Citi

Hi, good afternoon, everyone. Can I get you to talk about the profitability of chemicals in the current environment? I mean, Oil & Gas looks pretty clear, but I'm not sure how to think exactly about your chemicals business.

And then my other question, and this might be a very, very short answer, but what is your trading business doing with tankers in the Strait of Hormuz? I mean, do you have any traffic moving or do you see any arrangements where traffic can move? Thank you

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

I have good news on the second one. We had 10 tankers before the last weekend stuck in the Gulf. Now, we have nine because one of the tankers moved out of the Gulf during the weekend.

On Friday evening, when both parties announced that the strait would be reopened, we gave instruction immediately to our traders to try to get out. There were two tankers which were in the queue. The first one exited, the second one, unfortunately, was just after the Indian tanker, which was attacked.

In fact, all that was governed by the insurance company, because we got on Friday evening the insurance to go through the Strait on the Friday evening. And when there was an attack in the Sunday afternoon on the Indian tanker, then the insurance company told us there is no more insurance. So, we went back to the Gulf. So, this is the situation.

Honestly, we are following on this one and of course, if we can exit, it is the best. But we are following the news and we depend completely on the discussions between the different parties to the conflict, and that's the situation for us. So, this is where we are.

We have done a small business within the Gulf. Because we had some refined products tanker which was stored, we managed to offload it in one country and then to load it with some other crude oil. So we tried to do what we can inside the Gulf, as trading inside the gulf with these tankers is limited.

On chemicals, there are two different impacts there. First one, naphtha is more expensive because it's rare, it's scarce, we've seen that the cracker margin went down in March. But the good news is that at the same time, there is a scarcity globally of naphtha in Asia. And as you have scarcity in Asia, you have some people in Asia with crackers looking for naphtha. Then the price of the polymers has increased.

In April, for the first time, for long, I've seen positive results coming from my polymer business. So, I've observed in April that in all our businesses, including biofuels, the beginning of the scarcity implied by the crisis is pushing all our products in the green. We are benefiting from that, and that's the beauty of the integration we have. But I see that on the end-product, so, there are on the chemicals, some downside with the cracker, but the polymers are much better.

In particular, in the U.S. because when you are on gas (and that's the advantage to be in the petrochemicals not only on naphtha, but also as part of our chemicals in the U.S. on gas), and when you have polymer price going up and Henry Hub or ethane in the U.S. is stable, the margin is much better. So, I see some good signals on the chemical business, which are completely the consequence of this crisis.

Alastair Syme - Citi

So, net positive earnings in chemicals?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

Yes, exactly.

Mark Wilson – Jefferies Equity Research

Thank you very much. I think one area we haven't covered yet is refining. You are the only company that breaks out your refining very clearly in the annual report. In total, it's grown to just under 1.5 million barrels a day. And jet fuel, aviation fuel is about 10% of that, just over.

Could you give us the dynamics between the different main products? Do you have the ability or desire to move the amount, for instance, of aviation fuel that is produced versus diesel and others? And do you see cost headwinds as well as margin as we move through the year and into 2Q, as mentioned by other companies? Thank you.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

To be clear, in all our refineries today there is an instruction - with the limit of a refinery because in a refinery unfortunately you have a slate of products, but there are ways to optimize - for all of them in Europe, the instruction is: max jet first, and then max diesel, and then gasoline.

So, we try to maximize the two cracks, and in particular in these days, the ones that are the better, physical jet fuel even is better than the paper jet fuel, it is really high. So, maximizing jet and then maximizing diesel, in particular because in France we are a big consumer of diesel, and diesel crack was quite high, and then gasoline, we know that we have enough, European refineries are producing a lot of gasoline, so there is less incentive to do it.

So, we do the max, but we don't go from 10% to 20%. It's a matter of adding 2% to 3%, but each percent, of course, is good for the global refining margin. That is clear and we do it. We have done it immediately and systematically because these are the critical products: jet fuel and diesel, which we are more relying on imports for the European continent. So, of course, the margin is better. So, it's very logical, we've done that.

I'm not sure to have understood the question of the cost headwinds, what it is related to.

Mark Wilson – Jefferies Equity Research

Well, there's obviously been a lot of talk about the availability of feedstock and competition for crudes and certain grades of crudes. So, is there any impact?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

Yes, some feedstocks are scarce so they're more expensive. The refining margin was exceptionally high in March, around 25 \$/b but I think Jean-Pierre told you that it was very poor in January, February, and the 11.4 \$/b margin was a result of a very non-linear margin.

But in April, there was some volatility in the margins linked partly to more volatile, linked partially to the feedstock which were coming in the refinery. So, that's true, and on this one, clearly, I will tell you, there is a very strong connection between refining in the Company and trading.

And all that is optimized between both of them. In fact, they are competitive. The suppliers of refinery are exactly on the same desk next to the traders. And we interface between both of them in order to optimize the slate which will go to our refineries and what we should sell, among all our crude oil that our traders have access to, on the market. And we make it as an optimization for the Company. So, it may not be optimal for the trading itself, but if it's an optimum on the refining and trading as a combination, then we will take the feedstock to the refinery.

So, this is one of the advantages of having this strong integration and in particular in this type of period. I know some people were thinking that we might have a lack of crude oil. We will never have a lack of crude and so we optimize the type of feedstock we need to our refineries according to the access to many flows that our trading can generate.

Kim Fustier, HSBC

Firstly, on Qatar, how are you managing the force majeure situation in Qatar as it relates to your LNG portfolio and your commitments to customers? Just noting that one of your IOC peers who is also a partner in Qatar LNG, had to declare force majeure. And related to that, what is your view on the timeline of the Qatari LNG expansion project?

I also wanted to ask about SATORP. What's the repair timeline for the damaged units? And again, linked to that, what is the potential impact on the timeline of the Amiral project? Thank you.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

On Qatar, I don't know why people do not believe us. QatarEnergy has declared force majeure to its customers. That means that in Qatar, that we have some JVs with QatarEnergy, and the marketing of its J.V. is done by QatarEnergy.

So, our J.V., which are reported in the Upstream part, are not producing today, so there is no production, no revenue, and very logically and very professionally, QatarEnergy has immediately declared force majeure to its customers. That's one point.

From this perspective, TotalEnergies is a customer of QatarEnergy only for our own offtake. The difference between our competitor and ourselves is that because we are very exposed, and we know Qatar through the JVs, we have some limited contracts with Qatar for our own offtake, for our own portfolio.

And the amount is around 1.5 Mtpa. So, we have these 1.5 Mtpa. We received the force majeure from Qatar because we are a customer of them. But then we decided that we will not transfer it because in the way we work with our LNG portfolio, when we sign a contract with a Korean or Japanese buyer or a Thai buyer, we don't assign, we don't tell them if it is coming from Qatar because we are a portfolio Company. So, we took on ourselves.

And, by the way, we told them we are a portfolio Company. We produce in 11 countries. So, we secure user supply. So yes, we received the force majeure, but we decided we would take it for us. We could have declared it probably, but we decided that it was, in terms of commercial, in terms of what we advocate every day, for their customers, the best position, because probably 1.5 million tons is absorbable in a portfolio of 40 million tons. We will deliver, we will not transfer the force majeure to any of our customers. That's what we've done.

I know that our competitor is more exposed because, if I read correctly in the press, it's more 6 or 7 Mtpa than 1 to 2 Mtpa. So, probably, with 7 Mtpa, it was more logical for them. To be honest, my LNG traders were ready to exercise the force majeure, but the management said that "No, be careful with what we do." And so, we've done it like that.

Timeline on scheduled expansion, I think the Qatari themselves have said that today the impact is evaluated to two months, or something like that, on the expansion on NFE first train, because for NFE on the ground, Technip Energies and the teams are continuing to work onshore. The offshore works have been stopped. It was planned for Q3 2026. So, probably today, we are more on Q4 2026.

And again, there is a difference in all this wording between when you put the gas in and when you offtake the first LNG. So, if you want my bet in my plans, I would say first LNG offloaded from NFE is probably right at the end of 2026, beginning 2027. That's if I'm taking a bet on that. But that's where we are. And again, this is completely linked to how long this war will last because as long as we cannot restart works offshore, of course, this might impact the timeline.

SATORP, there are three units. I told you that the first unit will be repaired very quickly, the VDU. That means that SATORP is able to produce some VGO in 10 days. We could produce VGO at full capacity, but then you need to find a market, somebody who buys VGO. And as we cannot export VGO because the Strait of Hormuz is closed, we will be limited to something like 300-330,000 b/d.

And then we need to recover the two other units. The two other units are the conversion units, which allow us to transform the VGO in diesel and other products. Honestly today, we don't know. We have sent some experts, and we are working together with Aramco. There have been some damage to these units, so it's a matter of at least six months, maybe more, we don't know. We are working on it.

As we have been very transparent since the beginning of the conflict, when we'll have better news on it, but I would say more precise news, we will report to you.

At this stage, the teams of Aramco and TotalEnergies are working to evaluate the damage and more to evaluate the repair that we need to do. By the way, at TotalEnergies, we have insurance for this type of war events, which we might activate if the damages are higher than 150 M\$. So, this is our own limit, I would say, our threshold for ourselves.

Impact of Amiral, no. On Amiral, there are 22,000 people working today on the ground. That's why we have our secondees and Aramco. I went to Riyadh. We discussed a lot about Amiral. We have the full support of the authorities for Amiral.

Amiral is progressing. The progress of the Amiral project is today at 70%. The startup is planned by end of 2027, beginning 2028. Of course, the context might impact what I just tell you today and if the conflict worsens, this could change. So, this is just an update today with validity, but this is the situation for Amiral.

Matt Lofting - JPMorgan

Congratulations on the performance of the integrated model in what's clearly been exceptional times. I wanted to ask you: you guys, engage extensively with host governments globally. It's early days, but are you seeing any change in the tone of conversations as a result of recent events towards greater urgency, let's say, from some countries to develop domestic production and better secure energy supply?

And then second question is more specific to the financials, price and timing lags are an inherent part of several parts of TotalEnergies business. I wondered if you could just talk a bit about how that impacted Q1 given the sort of surge in commodity prices more kicked in in March, and how that then plays out as we look forward to the coming quarters? Thank you.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

On the second question, the obvious case is LNG because most of the contracts on LNG are based on a time lag of one, even two months. By the way, the average price of the quarter was 8.5 \$/MBtu, exactly what we planned in February in the trading statement, on the guidance that we gave in February. So, that means that there was no impact of the March oil prices or gas prices. We expect to see the impact of the March high prices clearly in the second quarter.

That's why we gave you a guidance, by the way, of 10 \$/MBtu, which again is reflecting the price of March, an assumption for some other months of 80 \$/b and a TTF around 14-15 \$/MBtu. So, again, if crude oil was higher and remains higher, that could impact positively the 10 \$/MBtu. So, this is the obvious case.

On the crude oil, we have some few things. We have one country where we have a formula which is with two months delay. It's the UAE, which creates, by the way, some difficulties and we are trying to solve them. Because when we have two months' delay, that means that we could face the day that it will reopen and selling prices would go down. We would have to pay with two months delay, that's not a good situation. We are discussing on that. But honestly, these are the main two.

There are also some impacts on polymers and things like that. In the plastic world, generally, you have also some delays in all the formulas. So, for example, I should have commented that in March, the naphtha that we bought was on the spot market. But the polymers and all the pricing do not reflect immediately the increase of the naphtha. So, that was negative for the naphtha. And this will be recouped in the second quarter. We don't have many time lags longer than one to two months. Maybe six months in exceptional situations, but it's very rare, in fact, in the portfolio.

Regarding hosts governments, I think I answered in my first answer to Michele. That was more or less the same question. I said to Michele it's quite clear that today you begin to see for sure that governments are looking to see whether they could develop their domestic production. They ask themselves how to secure their energy supply. I said electrification, I said more coal for countries who have coal, they will develop their coal. That's sure. India is more into coal. Renewables as well. So, that's positive for renewables, I think, in many countries, including in Europe. Nuclear, there was already a good momentum, but I would not be surprised to see a country like India again or China - China it's already done - with nuclear programs, like some European countries, like we did in France after 1973. And Japan - not a new country coming to it. So, that's obvious to me. Which is, as I said - for sure - a challenge for the gas because it's a competition. To produce electricity, gas-to-electricity. But gas is not only used for electricity, but it is also used for heating, by the way. It will be a challenge.

The other governments where I see a change of tone, as I told I visited of course our friends in the Middle East. It's clear that on the agenda today, you have the question of "Can we get around the Strait of Hormuz?". We are discussing again on projects to build some pipelines, to double the pipeline to Fujairah, to double pipelines to Saudi Arabia. Iraq, obviously, is in a situation where we need to revive some old pipelines which are stuck today, such as the pipeline crossing Syria. You have the pipeline through Turkey. So, for me, today, for these countries, the question of their own, not security of supply, but security of delivery, evacuating and commercializing will become high on the agenda of all these countries.

So, yes, this crisis - and again, because it's not only an isolated one, we had 2022, now, we have 2026. So, you have these questions about security of supply and affordability which is linked to that. And again, for me, it means how do we remunerate more capacities? We need to invest more in all these energy capacities. It will be high on the agenda and in many countries around the world.

Christopher Kuplent - Bank of America

Just two more questions remaining. When we think back to February and you gave us your outlook for cash flow during the year, you were referencing a 60 to 70 \$/b Brent range, refining margins at 5 \$/b, etc. We're now in a different world. You've talked yourself about 80 \$/b as a good starting point for the year. What can you tell us, how should we adapt your sensitivities that you've published, which I believe were meant for a 60 to 70 \$/b world rather than for an 80 to 100 \$/b world? And so, where would you like to make some adjustments or give us some warnings other than the volumes, of course, that you're not able to sell right now in terms of the validity of the sensitivities?

And then maybe as a quick second question, considering you haven't been active in the farm-out market, maybe I can ask you my favorite question, Patrick, what do you think is the current state of M&A? I know it's not one market. Power is very different from oil, from gas, but where would you rather be right now, a buyer or seller?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

So, first question, Chris, I invite you to read Page 13 of the press release. And you have this table and the sensitivity. And fundamentally, they are between 60 and 80 \$/b. You can extend 60 to 70 \$/b to 60 to 80 \$/b, all right? I have no doubt about it. The only point is that if we remain in a situation of today, without the Middle East production, then, of course, we must correct it. That's why we gave you a sensitivity of 10% on the Middle East production.

But I did math. If we were in an environment around 80 \$/b, 15 \$/MBtu, 7 \$/b of refining margin and without the Middle East, it would be around 32 B\$ of cash flow. But again, if the situation remains the same and if - and my scenario is not good, because if it remains the same, we'll not be at 80 \$/b during the whole year. So, if we lose really the production of the Middle East during the next nine months, I think you can correct my 80 \$/b to 100 \$/b or 110 \$/b. So, again, you can take around 3 B\$, it's 2.8 B\$ officially. And it's a little more, you're right, because, in fact, when we go high at 100 \$/b, the Middle East impact of the production, the loss of the 15% of volumes is no more 10% of cash flow, it will go down to 6 - 7%, which means that the higher we go, the more the sensitivity will rely on the barrels outside of the Middle East.

So, your question is good, but we need to make the math correctly at 100 \$/b. We will do it. And we might publish it if you want because this information is important, we might publish it on our Internet site. So, there is less impact from the production of the Middle East at 100 \$/b that we have at 60 \$/b, that's true as well. So, that's what I can say. So, any high scenario is a good news for integrated companies like TotalEnergies.

Now, M&A. M&A on oil is difficult because where is the right price there for the oil assets in the next three years? And there was a sort of consensus until the crisis, I think oil assets were more or less exchanged around 70 \$/b, I would say, in the market, it was more or less the average assumption. Today, to put 70 \$/b for the next three years, for 2026, 2027, 2028, I wouldn't agree if my teams are proposing me to sell at 70 \$/b. It's very difficult because there is no certainty at all about where the market will establish itself.

So, you could say it's 80 \$/b, it's 75 \$/b, you could say also maybe it's 100 \$/b. So, I think M&A on oil today is not an easy game to play. And I'm sure buyers would love to buy at 70 \$/b, but I'm sure sellers will be a little more difficult to convince. So, that's where I see that.

On the gas, different. We are looking on our side to U.S. gas business. The U.S. gas market has been stable, when you look to the assets on their side, it didn't move a lot valuation. So, that's easier on this side.

Power, they are all crazy in the U.S. with gas-fired power plant. So, it's not a good market to buy gas-fired power plant. They are more reasonable in Europe because we are not in love with gas in Europe. So, it's good to continue to make M&A on gas plants in Europe. And we are looking at some opportunities to complement the portfolio. An obvious country for us to look at is Germany in Europe from a power point of view. So, that is the situation.

And then if I continue M&A on renewables, by the way, I have good news for all of you. You didn't ask me the question, but we got the money from the U.S. government on our account yesterday. So, we have the famous 928 M\$. By the way, the share for TotalEnergies out of the 928 M\$, because we had some partners on one of the concessions, is 550 M\$. So, we'll have this cash incoming. It already came, it already came. So, on renewables, the market is influenced by higher interest rates. The multiples in that field are quite high compared to Oil & Gas. But I see a sort of impact of rising interest rates on the valuation of these assets

Henri Patricot - UBS

Just one quick question left from me. Going back to the trading great performance in the first quarter in both Oil & Gas. I was wondering if you have any comments on the second quarter. Should we be expecting a potential strong performance given we've seen already one month with significant volatility and maybe a full quarter of significant volatility in both markets?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

I cannot answer that question you know. We have no idea. Trading is not a matter of running a plant and taking the production, multiplying by an assumption on a price, minus the cost. It doesn't work like that. I can only comment that there is a very volatile market. The traders generally are quite happy when they see volatile market, up to a point, but when it's too volatile, there is some danger. And when the volatility is not related to supply and demand, but to the tweets of some authorities in the world, it's even more dangerous because you could face suddenly a reverse situation. So, we are not betting on price. Trading of TotalEnergies is an asset-backed trading and fundamentally we are not betting on the oil price. We are not exposed to flat price in the trading we do. So, no, it's not possible. I wish we will reiterate a strong performance. When we say in a press release that there is an exceptional performance, a strong performance, we qualify it compared to the normal run rate. The normal run rate of our trading is quite good. Again, I have no information.

By the way, there were a lot of comments in newspaper on one specific position which was taken by our crude oil traders. But you know, when they take a position on one side, they have some other positions on the other side. So, it's not one-sided. Yes, they took a position which was long in the gulf at the beginning of the war, that's true, but there were other positions which were not as positive. And by the way, our products trading team was quite good to benefit from the fact that in Asia, there was a scarcity of products. To be able to supply Asia with products, there was a strong performance. So, it's different markets, different flows. We'll see.

By the way, just to confirm to you, when I mentioned a figure to Chris. I think I said 32 B\$ of cash flow. I have normalized the trading to a normal run rate delivery and not an exceptional one. So, if they were repeating quarter after quarter same performance then my 32 B\$ is a little short of the reality. So, I cannot answer to you more than that, Henri. And a book of trading is plenty of trades, and we see the results at the end. But what I can confirm is that the trading division of TotalEnergies is quite successful, and I never see them underperforming the market. Either they are, I would say, around the average, or they make strong performance, that's it.

Fergus Neve - Rothschild & Co. Redburn

I just hoped you might be able to provide us with a bit of an update on some of the key projects which are due to come online this year. Perhaps if you could comment on Ratawi Phase 1, which I imagine is affected by the current situation in the Middle East and then maybe also Tilenga due to come online later this year, that'd be really helpful.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

On Ratawi, we have, I said, that we have 5,000 people working on the ground, but there is no way to export the crude oil. So, we were planning to start up by Q2. I would say, logically, what I can answer to you today is more to Q3 than Q2. The question will be not only to build the plant, the plant is almost done, in fact, it was a question of one month and a half on Ratawi. But it's more a question to be able to produce the oil and to export it, which is today the limit to allow to start up Ratawi. So, as quickly as we can, obviously, and no problem regarding the wells are drilled, easy oil to produce. Restarting Ratawi is a matter of few days, and we have teams on the ground, so it's easy. By the way, we have started up just before the conflict, the solar plant in Ratawi. The first project which came on stream was the solar plant and the 300 MW phase. And the authorities were quite happy because facing a lack of gas for making electricity, we are supplying some solar electrons to the Basra area now since end of February.

Tilenga is moving on. I mean, we told you that the start of production for Tilenga will be end of end of Q4. We were explicit in February, I think. So, there is no change on this part. What is progressing well is EACOP. We think that EACOP might be completed in September or October. And Kingfisher, the other project in Uganda where we are a partner, will be probably ready by summertime. It's possible that we'll begin to flow the oil from Kingfisher first through EACOP. It's a long pipeline to fill. But the operations and crude oil productions from Uganda might start up just after the summer, September, end of Q3, and then Tilenga is Q4.

Jean-Luc Romain – CIC-CIB

My question relates actually to the offshore U.S., where you just announced you had the cashback. Do you consider offshore wind U.S. as a dead zone for the foreseeable future or do you still see it as a future development zone in case the current administration would become more receptive to this kind of development?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

No, I was clear, I commented that in a U.S. newspaper, I think. I could use a word of Darren Woods, "It's non-investable." It's non-investable because the cycle of an offshore wind project is much longer than the duration of a U.S. administration. And offshore wind requires a long cycle of permitting, developing, negotiating. So, if every four years you are stuck because you have a change, no, it's not possible, but more fundamentally than that. When we studied all these projects in front of New York, New Jersey, it was very difficult. The offshore part was quite in line with what we expected even if there was some cost increase from the turbine point of view. But what was very expensive was the subsea cable and landing a cable, subsea cable, to serve New York, a very urban city, and New Jersey, it was much more expensive than planned. So, at the end of the day, we would be able to deliver electricity of around 150 \$/MWh.

It's much more expensive than what you can do in the U.S. So, in terms of allocation of capital and considering the various ways to produce electricity in the U.S., with plenty of gas, with solar, onshore solar, onshore wind, it's better

for us to develop our position in the U.S., but with the most efficient allocation of our own capital, and for consumers as well.

So, no, the answer is, definitely, at TotalEnergies, we consider that it's not a good market for developing offshore wind. And, in fact, what I'd also say, I think developing offshore wind requires some specific market. It's a question of cost merit curve to produce electricity. So, U.K., Germany, France are some interesting countries because they have less capacity to develop onshore renewables because of limited space, in fact. So, there is a market there. So, we will concentrate on these projects. And the other lesson we draw on offshore wind is that it needs to be big to be profitable. So, we are cleaning our portfolio. We had small projects in Denmark. We are just exiting it, because it does not fly.

Markets? Honestly, Brazil, Philippines, India, forget all that. There is no interest. There are plenty in Brazil. You can produce plenty onshore wind in Nordeste with Casa dos Ventos which costs much less than offshore wind. So, offshore wind is more expensive so it should be dedicated to markets which could afford it and which need it. That's the conclusion which we draw for ourselves. So, we'll concentrate on some projects which are large, by the way, on which we believe that the fundamentals are good. And so, that's the reality. So, you will not see newspapers and press release that TotalEnergies is back in U.S. offshore wind. At least as long as I am the CEO and Chairman of the Company.

Anish Kapadia – Palissy Advisors

I wanted to ask about battery storage, and especially in the context of seeing Europe having its earliest curtailments of renewables this year, the record level that's expected this year and the extreme negative pricing. So, I just wanted to get, what's your view on battery storage growth in Europe, how you see the Iran conflict accelerating this, and then what's the role of TotalEnergies and Saft within this context?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

I will tell you. Fundamentally, it's not linked to the conflict. When you develop renewables, you should put batteries. So, good news during the last two years, in fact, the cost of batteries has dramatically decreased. They have been divided almost by two for battery cells. Thanks again, by the way, to Chinese suppliers, but it's a reality. So, you have a strong decrease of batteries costs. And I think it's absolutely necessary not only in order to avoid curtailment, but it's also a matter of grid management that when you develop a renewable farm, you should have some battery. I'm against the CfD [*Note: Contract for Difference*] scheme in Europe because in the CfD scheme, the developer, the solar or wind developer, has zero obligation to build a battery. He's securing a price from the state and sometimes the states are smarter, they say, "We don't pay you if it's negative." But, in fact, it's just a strange scheme, in fact, the CfD. The scheme which is working in the U.S. where you have some fiscal support on your Capex, ITC, or PTC, is much better because, in fact, if you are facing the market and you develop your solar plant, and, for sure, you always build a battery storage with the solar plant. Otherwise, you are dead and your profitability will be low. The more we see, as you said, investments and development of new solar farms, like in Spain, for example, but even Germany, we begin to see the limits and the curtailment is higher and higher because there are no batteries. So, yes, I think it's time to really incentivize battery storage.

On our side, we are investing in batteries in particular in Germany, where it's a good market because there is a lot of renewables, we have a company which we acquired two years ago, and we are developing 2 to 3 GW of batteries. We just farmed down part of them at 50% to Allianz Global Investors with a good profitability. So, we think that there is a real market, in particular, in Europe. And it's not only because of the Iran conflict. It should be accelerated. If Europeans

are serious about, I would say, developing the penetration of renewables in Europe, it's absolutely fundamental to do it together with batteries, to stabilize the grid and to be able to absorb the most of this renewable production. And Saft, to come back, Saft is good, is strong. It's developing very well in the energy storage system business. So, I think they are number four or five in the world, and they are taking quite a lot of markets. It was one of the reasons why we acquired Saft. But it's a little long for this market to take off, but now, it's really full speed on it. And there are also some technology improvements which allow to think that the cost could also, when we were discussing with the Saft CEO, he thinks that the battery storage has already diminished by 50%, but another 30% decrease is possible on the cost, thanks to a higher density of energy storage, et cetera...

Bertrand Hodée – Kepler Chevreux

It's a follow-up on Mark's question on refining. One of your competitors explained yesterday that because of various factors like major dislocation and crude differentials, product yields or freight costs, its realized refining margin in April was about 5 \$/b less than its headline margin indicator. So, do you see that? And can you also tell us, what is the average of TotalEnergies refining margin indicator so far in April?

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

I didn't see such a large dislocation, to be honest. The realized refining margin in the first quarter was around 10.5 \$/b, while the indicator we gave you was around 11.4 \$/b. So, it was a little lower, but not 5 \$/b. So, we suffered less. I will give you an other figure just to show some solidarity with my colleague. In March, the ERM indicator was around 25 \$/b, and the MCV of refining, the realized margin on variable cost, was around 21.5 \$/b. So, you didn't have 5 \$/b, but 3.5 \$/b difference. Why? Because, honestly, these paper markets today, these indicators are difficult to follow. Now it is going that way, the other month it could be the other way. So, we are trying, each of us, to trace an indicator to give a sense of what is happening on the market. But there is a dislocation, and it's perfectly true today for the products. By the way, it was an extraordinary situation in March where you've seen high oil prices and high refining margins. Normally, it's rebalancing, it's countercyclical.

So, again, at the end, what I know is that I've never seen in my life such high margins on the paper, so it's good, and even if there is a little difference between the paper indication and the realization, it's still delivering very good and strong results, so, that's the situation.

I know we have a debate internally, because daily, our teams are calculating this famous refining indicator based on the market, and we have some big doubts because on the other side, when we see that we can sell jet fuel at more than 200 \$/b, we are not sure that all that is completely consistent. So, as you have a dislocation between the physical market and the paper market, which is quite astonishing, at certain point, it should converge. This type of indicators do not reflect the reality of what is happening on a day-to-day marketing of the products.

Patrick Pouyanné - TotalEnergies SE - Chairman & CEO

Thank you for your attendance and your comments. I think it was a quarter where once again, we demonstrated the strength of our model. I think we will not disappoint you in terms of return to shareholders. The share of TotalEnergies since we have been listed in the New York Stock Exchange on December 8th, 2025, I'm looking to that as a starting point of the renaissance of the Company, has over-performed all our peers by quite a margin. So, I hope that this set of results will help to maintain it. And again, if we can attract more shareholders to TotalEnergies and globally, to the sector, it's good. So, thank you for your attendance and I think we'll have opportunity to meet in the coming months. And our shareholders, for sure, will meet on the Annual General Meeting on May 29, 2026 in Paris. So, thank you again.

Operator

Ladies and gentlemen, this concludes the conference call. Thank you for your participation. You may now disconnect.
